1 2-SAT

```
map<string, int> mp;
string c1, c2;
int vis[MAXN], low[MAXN], num[MAXN], sat[MAXN], dfs_counter, scc_counter
    ,n, test = 1;
vector<vector<int>> graph(MAXN);
stack<int> st;
```

//Find strongly connected components

```
void tarjan(int u, int depth) {
    low[u] = num[u] = depth;
    st.push(u);
    vis[u] = 1;
    for(int i = 0; i < graph[u].size(); i++) {
        int v = graph[u][i];
        if(num[v] == -1){
            tarjan(v, depth+1);
        }
        if (vis[v]){
            low[u] = min(low[u], low[v]);
        }
    }
    if(low[u] == depth) {
        while(1) {
            int next = st.top();st.pop();
            sat[next] = scc_counter;
            vis[next] = 0;
            if(u == next) break;
        }
        ++scc_counter;
    }
}
```

```
/*
To use the 2-SAT property, it could be transformed in a boolean logic
with AND or OR
```

75

76

76

A | B, means !A -> B
!A | B, means !!A -> B equals to A -> B
A | !B means !A -> !B
!A | !B means !!A -> !B equals to A -> !B

"-> is an implicant to separate the usage of A AND B"

2-sat property is YES if all the components have no disturbs, e.g.:
If you find !A and A in the same "scc", you're talking that !A = true
AND A = true, it is not right.

```
