    scanf("%d", &N);
    for (int i = 0; i < MAX; i++) indice[i].clear();
    cnt = 1;
    memset (sig, 0, sizeof (sig));
    for (int i = 0; i < N; i++){
        scanf("%s", t);
        add (t, i);
    }
    aho();
    scanf("%s", texto);
    busca (texto);
    return 0;
}
```

2.   Articulation Point in Graph

```c
vector<int> graph[410];
set<int> ans;
set<int>::iterator it;
```

```
int dfs(int u){
    int less = vis[u] = times++;
    int filhos = 0;
    for(int i = 0; i< graph[u].size(); i++){
        if(vis[graph[u][i]]==0){
            filhos++;
            int m = dfs(graph[u][i]);
            less = min(less,m);
            if(vis[u] <= m && (u != 0 || filhos >= 2)){
                ans.insert(u);
            }
        }else{
            less = min(less, vis[graph[u][i]]);
        }
    }
    return less;
}
times = 1;
ans.clear();
dfs(0);
```

3.   Bellman Ford

```
vector <pair<int, int> > edges;
int graph[MAXN][MAXN];
int dist[MAXN];

int N;
bool bellman_ford(int s) {
        int M = edges.size();
        memset (dist, INF, sizeof(int)*n);
        dist[s] = 0;
        for (int k = 0; k < N-1; ++k) {
                for (int j = 0; j < M; ++j) {
                        int u = edges[j].first;
                        int v = edges[j].second;
                        if (dist[u] < INF && dist[v] > dist[u] +
                            graph[u][v])
                                dist[v] = dist[u] + graph[u][v];
                }
        }
```

```
        //Negative Cycle
        for (int j = 0; j < m; ++j) {
                int u = edges[j].first, v = edges[j].second;
                if (dist[u] < INF && dist[v] > dist[u] + graph[u][v]) {
                        return false;
                }
        }
        return true;
}
```

4.   Binomial Coefficient with DP

```
//Binomial Coefficient
//C(N, K) = N!/(K!(N - K)!)
//Dynamic Programming
int bin[N][K];

bin[0][0] = 1;

for (int n = 1; n < MAXN; n++) {
    bin[n][0] = 1;
    bin[n][n] = 1;

    for (int k = 1; k < n; k++) {
            bin[n][k] = bin[n - 1][k] + bin[n - 1][k - 1];
            if (bin[n][k] >= MOD) {
                    bin[n][k] -= MOD;
            }
    }
 }
```

5.   Binomial Coefficient

```
Int nCr(Int n, Int k) {
      Int res = 1;

      if (k > (n >> 1LL)) {
              k = n-k;
      }
```

4

```cpp
    for (Int i = 1; i <= k; i++, n--) {
            res = (res * n) / i;
    }

    return res;
}
```

6. Bipartite Check Algorithm

```cpp
bool dfs(int node, int c) {
    if(color[node] != 0) {
        if(color[node] == c) {
            return true;
        } else {
            return false;
        }
    }
    color[node] = c;
    for(int i = 1; i <= n; i++)
            if(gr[node][i] == 1) {
                    if(!dfs(i, -c)) {
                            return false;
                    }
            }
    }
    return true;
}
```

7. Catalan

```cpp
//Catalan numbers with DP
void getCatalan(int n){
    int catalan[n+1];
    int MOD = 100000000;
    for (int i=0; i <= n; i++){
        if (i==0 || i==1){
            catalan[i] = 1;
        }else{
            int sum =0;
```

```cpp
            int l, r;
            for (int k=1;k<=i;k++){
                l = catalan[k-1] % MOD;
                r = catalan[i-k] % MOD;
                sum = (sum + (l * r) % MOD) % MOD;
            }
            catalan[i] = sum;
        }
    }
}
//Preprocessing Fatorial numbers and Answer in O(1)
Int catalan(int N) {
        Int ans = fat[2 * N];
        Int p = ((fat[N] * fat[N + 1]) % MOD) % MOD;
        ans *= modpow(p, MOD - 2, MOD);

        ans = ((ans % MOD) + MOD) % MOD;

        return ans;
}
```

8. Closest Pair

```cpp
///----Closes pair with divide and conquer----///
struct point{
    double x, y;
    point(double a, double b): x(a), y(b){}
    point(){};
};

bool compareX(point a, point b){
    return a.x < b.x;
}

bool compareY(point a, point b){
    return a.y < b.y;
}

double bruteForce(vector<point> &p){
    double ans = 40000.*40001.;
    for(int i = 0; i < p.size(); i++){
        for(int j = i + 1; j < p.size(); j++){
```

```cpp
            double dst = hypot(p[j].x - p[i].x, p[j].y - p[i].y);
            if(dst < ans){
                ans = dst;
            }
        }
    }
    return ans;
}

double strip(vector<point> &p, double d){
    sort(p.begin(), p.end(), compareY);
    double ans = d;
    for(int i = 0; i < p.size(); i++){
        for(int j = i + 1; j < p.size() && (p[j].y - p[i].y) < d; j++){
            double dst = hypot(p[j].x - p[i].x, p[j].y - p[i].y);
            if(dst < ans){
                ans = dst;
            }
        }
    }
    return ans;
}

double X, Y;
int n;
double closest(vector<point> v){
    int n = v.size();
    if(n <= 3){
        return bruteForce(v);
    }
    vector<point> left;
    vector<point> right;
    int mid = n >> 1;
    for(int i = 0; i < mid; i++){
        left.push_back(v[i]);
    }
    for(int i = mid; i < n; i++){
        right.push_back(v[i]);
    }

    double lh = closest(left);
    double rh = closest(right);
    double d = min(lh,rh);
    vector<point> stripArray;
    for(int i = 0; i < n; i++){
```

```cpp
            if(fabs(v[i].x - v[mid].x) < d){
                stripArray.push_back(v[i]);
            }
        }
    }
    return min(d, strip(stripArray,d));
}

sort(pos.begin(), pos.begin()+n, compareX);
double ans = closest(pos);
```

9.   Coin Change

```cpp
//Coin Change
int dp[1001];
int coins[] = {1, 5, 10, 25, 50};

dp[0] = 0;

for(int i = 1; i <= N; i++) {
        int min = 1000001;
    for(int j = 0; j < M; j++) {
            if(coins[j] <= i) {
                int m = dp[i - coins[j]] + 1;
            if(m < min) min = m;
        }
    }
    dp[i] = min;
}
```

10.   Convex Hull

```cpp
//Convex Hull
struct point {
    int x, y;
    point(int x, int y): x(x), y(y){}
    point(){}
    bool operator <(const point &p) const {
        return x < p.x || (x == p.x && y < p.y);
    }
```

```cpp
    bool operator==(const point &p) const {
        return x == p.x && y == p.y;
    }
};
ll cross(const point &O, const point &A, const point &B) {
    return (A.x - O.x) * (B.y - O.y) - (A.y - O.y) * (B.x - O.x);
}

vector<point> convex_hull(vector<point> &P) {
    int n = P.size(), k = 0;
    vector<point> H(2*n);

    sort(P.begin(), P.end());

    for (int i = 0; i < n; i++) {
        while (k >= 2 && cross(H[k-2], H[k-1], P[i]) <= /*change to < to
            remove equal points */ 0) k--;
        H[k++] = P[i];
    }
    for (int i = n-2, t = k+1; i >= 0; i--) {
        while (k >= t && cross(H[k-2], H[k-1], P[i]) <= /*change to < to
            remove equal points */ 0) k--;
        H[k++] = P[i];
    }
    H.resize(k);
    return H;
}
```

11.   Convex Polygon Area

```cpp
//Area de um Poligono Convexo
double area() {
        int N = 4;

        //Points
        int[] x = { 2, -4, 5, 2 };
        int[] y = { 5, 3, 1, 5 };

        double ma = x[N - 1] * y[0], mb = x[0] * y[N - 1];

        for (int i = 0; i < N - 1; i++) {
                ma += (x[i] * y[i + 1]);
```

```cpp
                mb += (x[i + 1] * y[i]);
        }

        double ans = Math.abs((ma - mb) * 0.5);
}
```

12.   Count used Digits

```cpp
Int func(int val) {
        int digitCount = (int) log10(val) + 1;
        Int ans = 0LL;
        Int p = 1LL;

        for (int i = 0; i < digitCount - 1; i++) {
                ans += p * 9 * (i + 1);
                p *= 10;
        }

        ans += (val - p + 1) * digitCount;

        return ans;
}
```

13.   Cycle Retrieval Algorithm

```cpp
//It only works in graphs without compound cycles
bool inq[MAXN], vis[MAXN];

void dfs(int node, int parent, int len) {
        vis[node] = true;
        cle[node] = len;

        stk[stk_pointer++] = node;
        inq[node] = true;

        for (int i = 0; i < (int) graph[node].size(); i++) {
                int next = graph[node][i].first;
                int cost = graph[node][i].second;
```

```
                if (next == parent) continue;

                if (!vis[next]) {
                        dfs(next, node, len + cost);
                } else {
                        if (inq[next]) {
                                int curr;
                                int real_len = len + cost - cle[next];

                                while (stk_pointer > 0) {
                                        curr = stk[--stk_pointer];

                                        cycle_len[curr] = real_len;
                                        if (curr == next) break;
                                }
                        }
                }
        }

        if (inq[node]) {
                while (stk_pointer > 0) {
                        inq[stk[stk_pointer-1]] = false;
                        if (stk[stk_pointer-1] == node) {
                                stk_pointer--;
                                break;
                        }
                        stk_pointer--;
                }
        }
}

stk_pointer = 0;
dfs(1, -1, 0);
```

14. Days Counting

```
int meses[] = {0,31,28,31,30,31,30,31,31,30,31,30,31};
int dp[8000][13][34];

for(int i = -3113; i <= 4000; i++){
        for(int j = 1; j <= 12; j++) {
                for(int k = 1; k <= meses[j] + (isLeap(i) && j == 2); k++){
```

```
                        dp[i + 3113][j][k] = past++;
                }
        }
}
```

15. Dijkstra Algorithm

```
struct MyLess {
    bool operator()(int x, int y) {
        return dist[x] > dist[y];
    }
};

int dijsktra(int source, int destiny) {
        for(int i = 0; i <= 110; i++) {
                dist[i] = INT_MAX;
        }
        priority_queue<int, vector<int>, MyLess> q;
        dist[source] = 0;
        q.push(source);

        while(!q.empty()) {
                int tmp = q.top(); q.pop();
                for(int i = 0; i < graph[tmp].size(); i++) {
            int aux_dist = dist[tmp] + graph[tmp][i].second;
            int actual_dist = dist[graph[tmp][i].first];
            if(aux_dist < actual_dist) {
                dist[graph[tmp][i].first] = aux_dist;
                q.push(graph[tmp][i].first);
            }
        }
    }
        return dist[destiny];
}
// Reconstruo  do Caminho
vector<int> path;
int start = destiny;

while(start != -1) {
        path.push_back(start);
        start = prev[start];
}
```

16.   Dinic Algorithm

```cpp
//Max Flow dinic O(V^2*E)
const int MAXN = 101010;
const int INF = 101011;

struct edge {
    int to,rev;
    Int cap;
    edge(int to, Int cap, int rev): to(to), cap(cap), rev(rev) {}
};

vector<edge> G[MAXN];
Int level[MAXN];
int iter[MAXN];

void init(int N) {
    for (int i = 0; i < N; i++) {
        G[i].clear();
    }
}

void add_edge(int from,int to,Int cap) {
    G[from].push_back(edge(to, cap, G[to].size()));
    G[to].push_back(edge(from, 0, G[from].size()-1));
}

void bfs(int s) {
    memset(level, -1, sizeof(level));
    queue<int> que;
    level[s] = 0;
    que.push(s);

    while(!que.empty()) {
        int v = que.front();
        que.pop();
        for (int i = 0; i < G[v].size(); i++) {
            edge& e = G[v][i];
            if(e.cap > 0 && level[e.to] < 0) {
                level[e.to] = level[v] + 1;
                que.push(e.to);
            }
        }
    }
}
```

```cpp
}

Int dfs(int v, int t, Int f) {

```cpp
//modpow(a, n, mod) - calcula a^n % mod de maneira eficiente
int modpow(int a, int n, int mod) {
        int res = 1;
        while (n) {
                if (n&1) {
                        res=(res*a)%mod;
                }
                a=(a*1ll*a)%mod;
                n>>=1;
        }
        return res;
}
```

56. Modular Inverse for Primes

```cpp
/* This function calculates (a^b)%MOD */
int pow(int a, int b, int MOD) {
int x = 1, y = a;
    while(b > 0) {
        if(b%2 == 1) {
            x=(x*y);
            if(x>MOD) x%=MOD;
        }
        y = (y*y);
        if(y>MOD) y%=MOD;
        b /= 2;
    }
    return x;
}

int modInverse(int a, int m) {
    return pow(a,m-2,m);
}
```

57. N-th Palindrome Number

```cpp
//Return the N-th palindromic number
```

```cpp
std::string number_palindrome(int N) {
    if(N < 10){
        return std::string(1, char('0' + N));
    }
    long long sum = 0, digits = 1, v;
    for(; ; digits++){
        if(digits % 2 == 0){
            v = std::pow(10, digits/2-1) * 9;
        }else{
            v = std::pow(10, (digits+1)/2-1) * 9;
        }
        if(v + sum >= N) break;
        sum += v;
    }
    //I have to find the M-th palindromic number with X digits:
    long long Mth = N-sum;
    long long sz = (digits+1) / 2;
    long long pattern = std::pow(10, sz-1);
    pattern += (Mth-1);
    std::vector<int> tmp;
    while(pattern > 0){
        tmp.insert(tmp.begin(), pattern % 10);
        pattern /= 10;
    }
    int idx = digits-tmp.size() - 1;
    std::string ans = "";
    for(int i = 0; i < tmp.size(); i++){
        ans += std::string(1, char('0' + tmp[i]));
    }
    for(;idx >= 0;){
        ans += std::string(1, char('0' + tmp[idx--]));
    }
    return ans;
}
```

58. Next Permutation in Java

```java
boolean next_permutation(int[] p) {
        for (int a = p.length - 2; a >= 0; --a)
                if (p[a] < p[a + 1])
                        for (int b = p.length - 1; --b)
```

```
                    if (p[b] > p[a]) {
                            int t = p[a];
                            p[a] = p[b];
                            p[b] = t;
                            for (++a, b = p.length - 1; a < b;
                                ++a, --b) {
                                t = p[a];
                                p[a] = p[b];
                                p[b] = t;
                            }
                            return true;
                    }
            return false;
}
```

59.   Order Statistics Tree - STL

```cpp
//Order statistics tree inside STL
#include<bits/stdc++.h>
#include<ext/pb_ds/assoc_container.hpp>
#include<ext/pb_ds/tree_policy.hpp>
using namespace __gnu_pbds;
using namespace std;
template <typename T>
using ordered_set = tree<T, null_type, less<T>, rb_tree_tag,
    tree_order_statistics_node_update>;

int main(){
        ordered_set<int> s;
        s.insert(1);
        s.insert(3);
        cout << s.order_of_key(2) << endl; // the number of elements in
            the s less than 2
        cout << *s.find_by_order(0) << endl; // print the 0-th smallest
            number in s(0-based)
}
```

60.   Palindromic Check with DP

```cpp
//Checa por Palindromos
int T, N, dp[MAXN][MAXN];
char str[MAXN];

for (int i = 0; i < N; i++) {
    dp[i][i] = 1;
    if(i + 1 < N) dp[i][i + 1] = str[i] == str[i + 1];
}
for(int k = 2; k < N; k++) {
    for (int i = 0; i < N - k; i++) {
        dp[i][i + k] = dp[i + 1][i + k - 1] && str[i] == str[i + k];
    }
}
```

61.   Point Inside Triangle

```cpp
/* A utility function to calculate area of triangle formed by (x1, y1),
   (x2, y2) and (x3, y3) */
float area(int x1, int y1, int x2, int y2, int x3, int y3) {
    return abs((x1*(y2-y3) + x2*(y3-y1)+ x3*(y1-y2))/2.0);
}

/* A function to check whether point P(x, y) lies inside the triangle
     formed
   by A(x1, y1), B(x2, y2) and C(x3, y3) */
bool isInside(int x1, int y1, int x2, int y2, int x3, int y3, int x, int
    y) {
    /* Calculate area of triangle ABC */
    float A = area (x1, y1, x2, y2, x3, y3);

    /* Calculate area of triangle PBC */
    float A1 = area (x, y, x2, y2, x3, y3);

    /* Calculate area of triangle PAC */
    float A2 = area (x1, y1, x, y, x3, y3);

    /* Calculate area of triangle PAB */
    float A3 = area (x1, y1, x2, y2, x, y);

    /* Check if sum of A1, A2 and A3 is same as A */
    return (A == A1 + A2 + A3);
}
```

62.   Prim Algorithm

```
int g[MAXN][MAXN], used[MAXN], min_e[MAXN], sel_e[MAXN];
min_e[0] = 0;
for (int i = 0; i < n; ++i) {
        int v = -1;
        for(int j = 0; j < n; ++j) {
                if (!used[j] && (v == -1 || min_e[j] < min_e[v])) {
                        v = j;
                }
        }
        used[v] = true;
        if (sel_e[v] != -1) {
                ans += min_e[v];
        }
        for (int to = 0; to < n; ++to) {
                if (g[v][to] < min_e[to]) {
                        min_e[to] = g[v][to];
                        sel_e[to] = v;
                }
        }
}
```

63.   Quicksort

```
//Worst Case O(n^2) but usually O(n log(n))
void quicksort(int lo, int hi) {
    int i=lo, j=hi, h;

    int x=a[(lo+hi)/2];

    do {
        while (a[i]<x) i++;
        while (a[j]>x) j--;
        if (i<=j) {
            swap(a[i], a[j]);
            i++;
            j--;
        }
    } while (i<=j);

    if (lo<j) quicksort(lo, j);
```

```
    if (i<hi) quicksort(i, hi);
}
```

64.   Segment Tree - Lazy Propagation

```
void goDown(int node, int l, int r) {
    if (lazy[node]) {
        tree[node] += lazy[node];

        if (l != r) {

}
```

---

75. Suffix Array

```
//Suffix Array O(n log n) and LCP in O(n)
//Better Implementation

const int MAXN = 100005;

// Begins Suffix Arrays implementation
// O(n log n) - Manber and Myers algorithm

//Usage:
// Fill str with the characters of the string.
// Call SuffixSort(n), where n is the length of the string stored in str.
// That's it!

//Output:
// pos = The suffix array. Contains the n suffixes of str sorted in
//     lexicographical order.
//       Each suffix is represented as a single integer (the position of
//     str where it starts).
// rnk = The inverse of the suffix array. rnk[i] = the index of the
//     suffix str[i..n)
//       in the pos array. (In other words, pos[i] = k <==> rnk[k] = i)
//       With this array, you can compare two suffixes in O(1): Suffix
//     str[i..n) is smaller
//       than str[j..n) if and only if rnk[i] < rnk[j]
